

(12) **United States Patent**
Veith et al.

(10) **Patent No.:** **US 9,433,539 B2**
(45) **Date of Patent:** ***Sep. 6, 2016**

(54) **DISPOSABLE ABSORBENT ARTICLE WITH OVERLAPPING ABSORBENT ASSEMBLY SECURED TO FRONT AND BACK PANELS**

(71) Applicant: **Kimberly-Clark Worldwide, Inc.**,
Neenah, WI (US)

(72) Inventors: **Jerome Steven Veith**, Appleton, WI
(US); **Paul T. VanGompel**, Hortonville,
WI (US)

(73) Assignee: **Kimberly-Clark Worldwide, Inc.**,
Neenah, WI (US)

(*) Notice: Subject to any disclaimer, the term of this
patent is extended or adjusted under 35
U.S.C. 154(b) by 176 days.

This patent is subject to a terminal dis-
claimer.

(57) **ABSTRACT**

A disposable absorbent article has front and back panels,
each having an elastic film layer and each having first and
second zones. The first zone of each panel is extensible and
retractable and the second zone of each panel is non-
extensible and non-retractable. Each of the front and back
panels has first and second side edges. An absorbent assem-
bly is secured to the front and back panels. The absorbent
assembly has a first end secured to the second zone of the
front panel and a second end secured to the second zone of
the back panel. A pair of seams join the front and back panels
together at the first and second side edges to form a
disposable absorbent article having a waist opening and a
pair of leg openings.

DISPOSABLE ABSORBENT ARTICLE WITH OVERLAPPING ABSORBENT ASSEMBLY SECURED TO FRONT AND BACK PANELS

PRIORITY

This application is a continuation of application Ser. No. 13/404,586, filed on Feb. 24, 2012, now pending, which is a continuation of application Ser. No. 12/556,343, filed on Sep. 9, 2009, now U.S. Pat. No. 8,147,476, which is a continuation of application Ser. No. 10/449,988, filed on May 30, 2003, now U.S. Pat. No. 7,604,624. The entirety of application Ser. No. 13/404,586 and U.S. Pat. No. 8,147,476 and U.S. Pat. No. 7,604,624 are hereby incorporated by reference.

BACKGROUND OF THE INVENTION

A disposable absorbent article is designed for absorbing human exudate. The disposable absorbent article is similar in appearance, size and shape to a regular cloth underwear except that it is not designed to be laundered and reused two or more times. A disposable absorbent article is intended to be worn by persons, including infants, toddlers, or adults, and is designed for single or temporary use. The disposable absorbent article is meant to be disposed of after being used once. The disposable absorbent article is designed to be pulled up around the user's torso without having to first open the garment in order to place it on a person's body. The stretchability of the material used to construct the disposable absorbent article permits the garment to snugly conform to the anatomy of the user's torso. The disposable absorbent article can be manufactured to be an infant diaper, a child training pant, an adult incontinence garment, a feminine menstrual pant, etc.

Some disposable absorbent articles manufactured today resemble regular cloth underwear in that they have a waist opening and a pair of leg openings. Such disposable absorbent articles can be pulled up around the torso of a user in a similar fashion as regular cloth underwear. It has been found that a disposable absorbent article is generally more discreet when the front and back elastic panels snugly conform to the wearer's anatomy. It has also been found that a more comfortable article is obtained when the absorbent assembly does not extend and retract to match the movement of the front and back elastic panels.

Now a disposable absorbent article for absorbing human exudate has been invented that allows the front and back elastic panels to extend and retract without causing the absorbent assembly to move in a similar fashion thereby providing a better fit to the user's body.

SUMMARY OF THE INVENTION

Briefly, this invention relates to a disposable absorbent article for absorbing human exudate and a method of forming the article. The disposable absorbent article includes a front panel and a back panel with each having a first zone and a second zone. The first zone is extensible and retractable and the second zone is non-extensible and non-retractable. Each of the front and back panels also has an inner surface and first and second side edges. The second zone of each panel is spaced inward from the first and second side edges. An absorbent assembly bridges across and is secured to the front and back panels. The absorbent assembly includes a liquid pervious bodyside liner, a liquid-impervious outer cover and an absorbent positioned therebetween.

2

The absorbent assembly has a first end and a second end. The first end is secured to the second zone of the front panel and the second end is secured to the second zone of the back panel. The absorbent assembly is capable of being folded to enable the first and second side edges of the front panel to align with the first and second side edges of the back panel, respectively. A pair of seams join the front and back panels together at the first and second side edges to form a disposable absorbent article having a waist opening and a pair of leg openings.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a perspective view of a disposable absorbent article.

FIG. 2 is a top view of the spaced apart front and back panels showing the first and second zones.

FIG. 3 is a plane view of a disposable absorbent article showing an absorbent assembly secured to the inner surfaces of the front and back panels and showing a partial cut away view of the construction of the absorbent assembly.

FIG. 4 is a side view of the disposable absorbent article shown in FIG. 3.

FIG. 5 is a cross-sectional view of the disposable absorbent article shown in FIG. 3 taken along line 5-5.

FIG. 6 is a cross-sectional view of the disposable absorbent article shown in FIG. 3 taken along line 6-6.

FIG. 7 is a flow diagram of a method used to manufacture the disposable absorbent article of this invention.

DETAILED DESCRIPTION

Referring to FIG. 1, a disposable absorbent article 10 is depicted. The disposable absorbent article 10 is intended to be worn by persons, including infants, toddlers, or adults, and is designed for a single or temporary use. The disposable absorbent article 10 is meant to be disposed of after being used once instead of being laundered or dry cleaned for re-use. The term "disposable absorbent article" is herein defined to mean an absorbent article that is inexpensive and can be discarded by the consumer once it becomes soiled or otherwise unusable after a single use or after a few uses. In the context of disposable personal care absorbent articles, such articles are normally disposed of after they are soiled and are not meant to be laundered or treated for re-use and are distinguishable from limited use articles that can be used several times before being discarded, such as disposable razors and cigarette lighters. The disposable absorbent article 10 is designed to be pulled up around the user's torso without having to first open the article 10 in order to place it on a person's body. In FIG. 1, the disposable absorbent article 10 is shown as it would appear just prior to being pulled up around a user's torso.

Referring to FIGS. 2-4, the disposable absorbent article 10 has a longitudinal central axis X-X, a transverse central axis Y-Y, and a vertical central axis Z-Z. The disposable absorbent article 10 includes a front panel 12 having a first zone 14 and a second zone 16. The first zone 14 is extensible and retractable in at least one direction. Desirably, the first zone 14 is extensible and retractable in two or more directions. When the first zone 14 is extensible and retractable in only one direction, that direction should be approximately parallel to the transverse central axis Y-Y of the disposable absorbent article 10. The second zone 16 is non-extensible and non-retractable. The second zone 16 can be of any geometrical configuration but a rectangular or square configuration works well. The second zone 16 has a surface area

that is smaller than the surface area of the first zone 14. Desirably, the second zone 16 has a surface area that is less than about 25% of the surface area of the first zone 14. More desirably, the second zone 16 has a surface area that is less than about 20% of the surface area of the first zone 14. Most desirably, the second zone 16 has a surface area that is less than about 15% of the surface area of the first zone 14.

Still referring to FIGS. 2-4, the front panel 12 also includes an inner surface 18 and an outer surface 20. The inner surface 18 is in direct contact with the user's skin and is sometimes referred to as the bodyside surface. The outer surface 20 is situated opposite to the inner surface 18 and is spaced away from the skin of the user. The outer surface 20 is sometimes referred to as the garment facing surface since it can be in direct contact with the inner surfaces of the user's outer clothing.

Referring to FIG. 2, the front panel 12 further includes a first end 22, a second end 24, a first side edge 26 and a second side edge 28. The overall size and shape of the front panel 12 can vary to suit the size and anatomy of the actual user. For example, the front panel 12 of an infant diaper will be smaller than the front panel 12 of an adult incontinence garment. The first and second zones, 14 and 16 respectively, can be integrally formed from a single material or they can be formed from separate and distinct materials. The second zone 16 is spaced inward from the first and second side edges 26 and 28. The second zone 16 is also shown having an edge that is coterminous with the second end 24 of the front panel 12. The second zone 16 is located adjacent to or in an abutting relationship to the first zone 14. However, the second zone 16 should not overlay or be covered by any portion of the first zone 14. Desirably, the second zone 16 is surrounded on three sides by the first zone 14, as is shown in FIG. 2.

The front panel 12 can be formed from a material that is extensible and retractable in at least one direction. By "extensible" it is meant a material that is capable of being stretched, extended or elongated when a force, such as pulling, is applied to it. By "retractable" it is meant a material that is capable of quickly recovering, retracting or returning to substantially its pre-stretched, pre-extended dimension once the force used to extend the material has been removed. Because of hysteresis, a material might not be able to fully recover or return to its original pre-stretched length. Some materials might be extensible but are not retractable. For example, many conventional textile and non-woven materials, that lack an elastic component, are extensible but lack retractability to return rapidly to substantially their pre-stretched dimension. Such materials, including but not limited to, a cotton knit T-shirt material or blends of cotton and non-elastic synthetic fibers can be extended but are not considered retractable for the purposes of this invention unless some elasticizing material, agent or treatment is added.

The front panel 12 can be formed from an elastomeric material. An elastomeric material can be a single elastic sheet or layer, an elastic film, an elastic net-like material, a plurality of elastic strands arranged to form an elastic layer, an elastic laminate, etc. When a plurality of elastic strands is utilized, they can be positioned on at least one layer of woven or non-woven material. When an elastic laminate is used, it can consist of two or more layers bonded together by heat, pressure, heat and pressure, adhesives, ultrasonics, or a combination of any of the above. Other means of securing one or more layers together to form a laminate structure are known to those skilled in the art. In a laminate, only one of the layers needs to be an elastomeric layer.

Referring now to FIGS. 3 and 4, the front panel 12 is shown being formed as a three-layer laminate structure. The front panel 12 includes a first layer 30, a second or middle layer 32, and a third layer 34. The first and third layers, 30 and 34 respectively, are the outer layers and can be formed from the same material or from different materials. The first and third layers, 30 and 34 respectively, can be constructed from natural or synthetic fibers and can be a woven or non-woven material. The second or middle layer 32 has the elastic properties and is sandwiched between the first and third layers, 30 and 34 respectively. It should be noted that one or both of the outer layers 30 or 34 can be made from an elastic material, if desired.

The extensible and retractable properties of the first zone 14 of the front panel 12 can be in one direction but desirably are in two or more directions. More desirably, the extensible and retractable properties of the first zone 14 are in a direction approximately parallel to the transverse central axis Y-Y. The transverse direction extends laterally across the torso of the user of the disposable absorbent article 10 and extends from one hip bone to the other hip bone. Even more desirably, the extensible and retractable properties of the first zone 14 are in at least two directions, one direction being approximately parallel to the longitudinal central axis X-X and the other direction being approximately parallel to the transverse central axis Y-Y. Most desirably, the extensible and retractable properties of the first zone 14 are in multiple directions, or stated another way, in three or more directions extending over an arc of 360 degrees. The ability of the first zone 14 to extend and retract will provide the requisite force needed during use of the disposable absorbent article 10 to ensure that it snugly conforms to the anatomy of the wearer's torso.

The front panel 12 can be constructed from various materials. One suitable material is a stretch bonded laminate (SBL) where the elastic core or middle layer 32 is elongated before the two outer nonwoven layers 30 and 34 are attached. Exemplary SBL materials are described in U.S. Pat. No. 4,720,415 which is hereby incorporated by reference and made a part hereof. Another suitable material for the front panel 12 is a necked bonded laminate (NBL). The NBL material is also a three-layer laminate but the elastic core or middle layer 32 is not pre-stretched prior to being attached to the two outer nonwoven layers 30 and 34. Instead, the outer layers 30 and 34 are necked stretched before the elastic core or middle layer 32 is attached to them. Exemplary NBL materials are described in U.S. Pat. No. 5,336,545 which is hereby incorporated by reference and made a part hereof. Other examples of elastomeric materials that can be used for the front panel 12 include a continuous filament stretch bonded laminate (CFSBL), a vertical filament laminate (VFL), a necked stretch bonded laminate (NSBL) and a necked thermal laminate (NTL). Combinations of the above materials can also be used. Exemplary CFSBL materials are described in U.S. Pat. No. 5,385,775 which is hereby incorporated by reference and made a part hereof.

Furthermore, the front panel 12 can be constructed from an elastic film that is capable of being stretched in at least one direction. Desirably, the front panel 12 can be stretched in both the machine direction (approximately parallel to the longitudinal central axis X-X) and the cross-direction (approximately parallel to the transverse central axis Y-Y). The front panel 12 can also be formed from an elastic nonwoven that has a machine direction stretch and/or a cross-direction stretch.

5

Still further, the front panel 12 can be formed from two outer layers 30 and 34 with a plurality of elastic strands sandwiched therebetween. The elastic strands can be formed from LYCRA®. LYCRA® is a registered trademark of E. I. Du Pont De Nemours & Co., having an office at 1007 Market Street, Wilmington, Del. 19898. The elastic strands can be aligned approximately parallel to one another or be angled or skewed relative to one another. The elastic strands can also be uniformly or randomly spaced apart from one another. The elastic strands can vary in shape, size, configuration, and/or length. The diameter and/or cross-sectional configuration of the elastic strands, the decitex (weight in grams per 10,000 meters of a strand) of the elastic strands, and the tension imparted into the elastic strands can all be varied to suit one's particular product needs. The elastic strands can have a round, semi-circular, square, rectangular, oval or some other geometrical configuration. The elastic strands can overlap, intersect or crisscross at least one other elastic strand. The various ways of positioning, orienting, and adhering the elastic strands to the two outer layers 30 and 34 are well known to those skilled in the art.

It should be noted that the front panel 12 can also be constructed from a material that is substantially air permeable, if desired. Alternatively, the front panel 12 can be constructed from a material that is substantially air impermeable.

The front panel 12 can be formed from a single integral elastomeric material that exhibits both extensible and retractable characteristics. The material can then be treated, fused, deadened, chopped, conditioned or somehow altered so as to form the second zone 16. The elastic properties of the material can be deadened before, during or after the material is stretched. Hammering the material between two hardened surfaces can cause the material to lose its extensible and retractable properties in a given area. The material can also be treated with heat, pressure, heat and pressure, ultrasonics, chemicals, by mechanical means, or a combination of the above to remove its ability to elongate and retract. In this fashion, the second zone 16 can be formed. Alternatively, the second zone 16 can be a separated material that does not possess any extensible and retractable properties. In this case, the second zone 16 is secured to the first zone 14 in order to construct the front panel 12.

Referring again to FIG. 2, one can see that the first zone 14 of the front panel 12 encloses three sides of the second zone 16. Likewise, the first zone 38 of the back panel 36 encloses three sides of the second zone 40. This construction ensures that the second zones 16 and 40 are situated adjacent to an end, 24 or 48 respectively, of the front and back panels, 12 and 36 respectively.

Referring again to FIGS. 2-4, the disposable absorbent article 10 also includes a back panel 36 which is spaced apart, discontinuous and distinct from the front panel 12. The back panel 36 has a first zone 38 and a second zone 40. The first zone 38 is extensible and retractable in at least one direction. Desirably, the first zone 38 is extensible and retractable in two or more directions. When the first zone 38 is extensible and retractable in only one direction, that direction should be approximately parallel to the transverse central axis Y-Y of the disposable absorbent article 10. The second zone 40 is non-extensible and non-retractable. The second zone 40 can be of any geometrical configuration but a rectangular or square configuration works well. The second zone 40 has a surface area that is smaller than the surface area of the first zone 38. Desirably, the second zone 40 has a surface area that is less than about 30% of the surface area of the first zone 38. More desirably, the second

6

zone 40 has a surface area that is less than about 25% of the surface area of the first zone 38. Most desirably, the second zone 40 has a surface area that is less than about 20% of the surface area of the first zone 38.

It should be noted that the second zone 40 of the back panel 36 has a larger surface area than the second zone 16 of the front panel 12. One reason for this is that the front panel 12 usually has a smaller overall surface area than the back panel 36. The back panel 36 is typically larger in size for it has to cover the buttocks of the user.

Still referring to FIGS. 2-4, the back panel 36 also includes an inner surface 42 and an outer surface 44. The inner surface 42 is in direct contact with the user's skin and is sometimes referred to as the bodyside surface. The outer surface 44 is situated opposite to the inner surface 42 and is spaced away from the skin of the user. The outer surface 44 is sometimes referred to as the garment facing surface since it can be in direct contact with the inner surfaces of the user's outer clothing.

The back panel 36 further includes a first end 46, a second end 48, a first side edge 50 and a second side edge 52. The overall size and shape of the back panel 36 can vary to suit the size and anatomy of the actual user. For example, the back panel 36 for an infant diaper will be smaller than the back panel 36 for an adult incontinence garment. The first and second zones, 38 and 40 respectively, of the back panel 36 can be integrally formed from a single material or they can be formed from separate and distinct material. The second zone 40 is spaced inward from the first and second side edges 50 and 52. The second zone 40 is also shown having an edge that is coterminous with the second end 48 of the back panel 36. The second zone 40 is located adjacent to or in an abutting relationship to the first zone 38. However, the second zone 40 should not overlay or be covered by any portion of the first zone 38. Desirably, the second zone 40 is surrounded on three sides by the first zone 38, as is shown in FIG. 2.

The back panel 36 can be formed from the same material or from a different material as the front panel 12. The back panel 36 is extensible and retractable in at least one direction. The definitions for "extensible and retractable" are as defined above with reference to the front panel 12. The back panel 36 can be formed from an elastomeric material. An elastomeric material can be a single elastic sheet or layer, an elastic film, an elastic net-like material, a plurality of elastic strands arranged to form an elastic layer, an elastic laminate, etc. When a plurality of elastic strands is utilized, they can be positioned on at least one layer of woven or non-woven material. When an elastic laminate is used, it can consist of two or more layers bonded together by heat, pressure, heat and pressure, adhesives, ultrasonics, or a combination of any of the above. Other means of securing one or more layers together to form a laminate structure are known to those skilled in the art. In a laminate, only one of the layers needs to be an elastomeric layer.

Referring again to FIGS. 3 and 4, the back panel 36 is shown being formed as a three-layer laminate structure. The back panel 36 includes a first layer 54, a second or middle layer 56, and a third layer 58. The first and third layers, 54 and 58 respectively, are the outer layers and can be formed from the same material or from different materials. The first and third layers, 54 and 58 respectively, can be constructed from natural or synthetic fibers and can be a woven or non-woven material. The second or middle layer 56 has the elastic properties and is sandwiched between the first and third layers, 54 and 58 respectively. It should be noted that

one or both of the outer layers **54** or **58** can be made from an elastic material, if desired.

The extensible and retractable properties of the first zone **38** of the back panel **36** can be in one direction but desirably are in two or more directions. More desirably, the extensible and retractable properties of the first zone **38** are in a direction approximately parallel to the transverse central axis Y-Y. The transverse direction extends laterally across the torso of the user of the disposable absorbent article **10** and extends from one hip bone to the other hip bone. Even more desirably, the extensible and retractable properties of the first zone **38** are in at least two directions, one direction being approximately parallel to the longitudinal central axis X-X and the other direction being approximately parallel to the transverse central axis Y-Y. Most desirably, the extensible and retractable properties of the first zone **38** are in multiple directions, or stated another way, in three or more directions extending over an arc of 360 degrees. The ability of the first zone **38** to extend and retract will provide the requisite force needed during use of the disposable absorbent article **10** to ensure that it snugly conforms to the anatomy of the wearer's torso.

The back panel **36** can be constructed from various materials. One suitable material is a stretch bonded laminate (SBL) where the elastic core or middle layer **56** is elongated before the two outer nonwoven layers **54** and **58** are attached. Another suitable material for the back panel **36** is a necked bonded laminate (NBL). The NBL material is also a three-layer laminate but the elastic core or middle layer **56** is not pre-stretched prior to being attached to the two outer nonwoven layers **54** and **58**. Instead, the outer layers **54** and **58** are necked stretched before the elastic core or middle layer **56** is attached to them. Other examples of such elastomeric materials that can be used for the back panel **36** include a continuous filament stretch bonded laminate (CFSBL), a vertical filament laminate (VFL), a necked stretch bonded laminate (NSBL) or a necked thermal laminate (NTL). Combinations of the above materials can also be used.

Furthermore, the back panel **36** can be constructed from an elastic film that is capable of being stretched in at least one direction and, desirably, in both the machine direction (approximately parallel to the longitudinal central axis X-X) and the cross-direction (approximately parallel to the transverse central axis Y-Y). The back panel **36** can also be formed from an elastic nonwoven that has a machine direction stretch and/or a cross-direction stretch.

Still further, the back panel **36** can be formed from two outer layers **54** and **58** with a plurality of elastic strands sandwiched therebetween. The elastic strands can be formed from LYCRA®. LYCRA® is a registered trademark of E. I. Du Pont De Nemours & Co., having an office at 1007 Market Street, Wilmington, Del. 19898. The elastic strands can be aligned approximately parallel to one another or be angled or skewed relative to one another. The elastic strands can also be uniformly or randomly spaced apart from one another. The elastic strands can vary in shape, size, configuration, and/or length. The diameter and/or cross-sectional configuration of the elastic strands, the decitex (weight in grams per 10,000 meters of a strand) of the elastic strands, and the tension imparted into the elastic strands can all be varied to suit one's particular product needs. The elastic strands can have a round, semi-circular, square, rectangular, oval or some other geometrical configuration. The elastic strands can overlap, intersect or crisscross at least one other elastic strand. The various ways of positioning, orienting,

and adhering the elastic strands to the two outer layers **54** and **58** are well known to those skilled in the art.

It should be noted that the back panel **36** can also be constructed from a material that is substantially air permeable, if desired. Alternatively, the back panel **36** can be constructed from a material that is substantially air impermeable.

The back panel **36** can be formed from a single integral elastomeric material that exhibits both extensible and retractable characteristics. The material can then be treated, fused, deadened, chopped, conditioned or somehow altered so as to form the second zone **40**. Hammering the material between two hardened surfaces can also cause the material to lose its extensible and retractable properties in a given area. The material can also be treated with heat, pressure, heat and pressure, ultrasonics, chemicals, by mechanical means, or a combination of the above to remove its ability to elongate and/or retract. In this fashion, the second zone **40** can be formed. Alternatively, the second zone **40** can be a separated material that does not possess any extensible and retractable properties. In this case, the second zone **40** is secured to the first zone **38** in order to construct the back panel **36**.

Referring again to FIGS. 1 and 3-5, the disposable absorbent article **10** also includes an absorbent assembly **60**. The absorbent assembly **60** includes a liquid pervious bodyside liner **62**, a liquid-impervious outer cover **64**, and an absorbent **66** positioned therebetween. A surge layer **68** can be optionally used which is located between the bodyside liner **62** and the absorbent **66**. The surge layer **68** can function to rapidly acquire and temporarily retain body fluid, such as urine, before it can be absorbed into the absorbent **66**. Desirably, the surge layer **68** is also capable of wicking the body fluid lengthwise and/or widthwise across its surface, as well as directing the body fluid downward in a z-direction (approximately parallel to the vertical axis Z-Z) toward the absorbent **66**.

The absorbent assembly **60** has a first end **70**, a second end **72**, a first side edge **74** and a second side edge **76**. Desirably, the absorbent assembly **60** is secured to the inner surface **18** of the front panel **12** approximate the first end **70** by an attachment **78** and is secured to the inner surface **42** of the back panel **36** approximate the second end **72** by an attachment **80**. Alternatively, the absorbent assembly **60** could be secured to outer surface **20** of the front panel **12** approximate the first end **70** by the attachment **78** and could be secured to the outer surface **44** of the back panel **36** approximate the second end **72** by the attachment **80**. The absorbent assembly **60** is secured to the front and back panels, **12** and **36** respectively, either before or after each panel **12** and **36** has been stretched a predetermined amount. By attaching the absorbent assembly **60** to the front and back panels, **12** and **36** respectively, the absorbent assembly **60** is capable of moving downward away from the user's torso while the front and back panels, **12** and **36** respectively, maintain their snug position against the user's torso. This unique ability for the absorbent assembly **60** to move outward and downward away from the user's torso without undue restrictions from the front and back panels, **12** and **36** respectively, produces a useful undergarment. The absorbent assembly **60** is capable of taking in and retaining additional body fluid as it moves out away from the user's body.

The attachments **78** and **80** can be by various means and can include permanent attachments as well as removable or releasable attachments. Desirably, the attachments **78** and **80** are permanent attachments where they are not designed to be removed without destroying the bond. The attachments **78**

and **80** can be formed by using glue, adhesive, ultrasonic bonds, heat bonds, pressure bonds, heat and pressure bonds, a combination of any of the aforementioned, etc. The attachments **78** and **80** can also include a mechanical fastener, such as by sewing with thread, using buttons and button holes, using snaps, by employing hook and loop fasteners, etc. A hook and loop fastener is generally considered a releasable attachment. One type of hook and loop fastener is VELCRO® wherein a hook material is releasably engaged into a loop material. VELCRO® is a registered trademark of Velcro USA, Inc. having an office at 406 Brown Avenue, Manchester, N.H. 03103.

The attachments **78** and **80** can be formed along a continuous line or over a surface area having a predetermined length and width. Alternatively, the attachments **78** and **80** can consist of intermittent point bonds that are spaced apart from one another. For example, the intermittent point bonds can be formed by using a hot or cold melt adhesive or by forming ultrasonic bonds. Various bond formations can be used which are known to those skilled in the art. Desirably, the attachments **78** and **80** are formed using intermittent bonds.

Referring again to FIGS. **3** and **4**, one will notice that the absorbent assembly **60** is positioned to overlay the second zones **16** and **40** of the front and back panels, **12** and **36** respectively. Each of the second zones **16** and **40** can have the same width dimension or a width of a different dimension. Desirably, each of the second zones **16** and **40** has a width of the same dimension. The width of the absorbent assembly **60** can be greater than, equal to or less than the width of either of the second zones **16** and **40**. However, the absorbent assembly **60** is secured only to the second zones **16** and **40** so as not to extend and retract with the movement of the first zones **14** and **38** of the front and back panels, **12** and **36** respectively. This method of attachment will assure that the absorbent assembly **60** remains relatively stationary while the front and back panels, **12** and **36** respectively, are capable of extending and retracting in correspondence to movement of the user's torso. In FIGS. **3** and **4**, one will also notice that the absorbent assembly **60** is positioned such that a greater portion of it is located over the back panel **36** than over the front panel **12**. This placement of the absorbent assembly **60** over a greater portion of the back panel **36** provides a better functioning disposable absorbent article **10**, especially one that is designed to absorb both body fluid from the penis or vagina, as well as solid and semi-solid excrement from the anus. In addition, the front panel **12** is usually smaller in size than the back panel **36**. This size difference also influences the placement of the absorbent assembly **60** over a greater portion of the back panel **36**. The result is that the first end **70** of the absorbent assembly **60** is secured to the front panel **12** at a location that is closer to the second end **24** of the front panel **12** than it is to the first end **22**. Likewise, the second end **72** of the absorbent assembly **60** is secured to the back panel **36** at a location that is closer to the second end **48** of the back panel **36** than to the first end **46**.

Referring now to FIGS. **3-6**, one will notice that when the absorbent assembly **60** is secured to the front and back panels, **12** and **36** respectively, a crotch region **82** is formed. The crotch region **82** separates the front panel **12** from the back panel **36** and is designed to cover the perineum area of the wearer. The crotch region **82** can cover a distance of a few inches in an infant diaper to several inches in an adult incontinence garment. For example, a crotch region **82** in an infant diaper may range from about 2 inches (about 5 centimeters(cm)) to about 10 inches (about 25 cm); while in

an adult incontinence garment, the crotch region **82** may range from about 6 inches (about 15 cm) to about 20 inches (about 51 cm).

The absorbent assembly **60** can be stretchable or non-stretchable in relation to the front and back panels, **12** and **36** respectively. Desirably, the absorbent assembly **60** is non-stretchable in relation to the front and back panels, **12** and **36** respectively. By having the absorbent assembly **60** be non-stretchable in relation to the front and back panels, **12** and **36** respectively, it is meant that the absorbent assembly **60** will not stretch appreciably in the longitudinal or transverse directions. For example, the absorbent assembly **60** will have less than about 50% of the stretch of the front and/or back panels, **12** and/or **36** respectively. Desirably, the absorbent assembly **60** will have less than about 25% of the stretch of the front and/or back panels, **12** and/or **36** respectively. More desirably, the absorbent assembly **60** will have less than about 10% of the stretch of the front and/or back panels, **12** and/or **36** respectively. Most desirably, the absorbent assembly **60** will have less than about 5% of the stretch of the front and/or back panels, **12** and/or **36** respectively.

The reason for making the absorbent assembly **60** non-stretchable is that the front and back panels, **12** and **36** respectively, are elastically stretchable and can expand and contract to snugly conform to the user's anatomy, especially to the wearer's torso. The absorbent assembly **60** is designed not to expand and contract as the front and back panels, **12** and **36** respectively, stretch or retract since the absorbent assembly **60** is bonded to the non-extensible and non-retractable second zones **16** and **40**. This feature allows the absorbent assembly **60** to remain positioned over the user's perineum. As the absorbent assembly **60** receives body fluid and/or excrement discharged by the wearer, it will be displaced outward and downward, away from the user's torso. The ability of the absorbent assembly **60** to move outward away from the user's torso as additional body fluid is absorbed and retained is a direct result of the fact that it is not restricted from such movement in the crotch region **82** by the front or back panels, **12** and **36** respectively. The attachments **78** and **80** assure that the absorbent assembly **60** covers the perineum but is capable of moving outward away from the torso as additional body fluid is received and retained.

Referring now to FIGS. **1**, **3** and **6**, the disposable absorbent article **10** also has at least one elastic member **84** positioned adjacent to and aligned approximately parallel to each of the first and second side edges **74** and **76** of the absorbent assembly **60**. Each of the elastic members **84** is situated between the bodyside liner **62** and the outer cover **64**. The elastic members **84** provide a gasket to hold the first and second side edges, **74** and **76** respectively, of the absorbent assembly **60** against the user's body. Each of the elastic members **84** can be in the form of an elastic strand, ribbon or strip. Desirably, from two to six elastic members **84** will be positioned adjacent to each of the first and second side edges, **74** and **76** respectively. In FIGS. **3** and **6**, two elastic members **84** are shown positioned adjacent to each of the first and second side edges, **74** and **76** respectively. The elastic members **84** are shown as having a round cross-sectional configuration although various other geometrical configurations can be utilized. The elastic members **84** extend parallel to the longitudinal central axis X-X and extend completely through the crotch region **82**. Desirably, the ends of the elastic members **84** will be located within the front and back panels, **12** and **36** respectively.

Referring again to FIGS. **1-4**, the absorbent assembly **60** is capable of being folded transversely, approximate the

11

transverse central axis Y-Y, to enable the first and second side edges 26 and 28 of the front panel 12 to align with the first and second side edges 50 and 52 of the back panel 36, respectively. A pair of seams 88 and 90 is then formed to join the front panel 12 to the back panel 36. The seam 88 secures the second side edge 28 of the front panel 12 to the second side edge 52 of the back panel 36 while the seam 90 secures the first side edge 26 of the front panel 12 to the first side edge 50 of the back panel 36. One will notice that FIG. 3 is an open view of the interior of the disposable absorbent article 10 and the front panel 12 is folded along the transverse central axis Y-Y such that the front panel 12 lies over the top of the back panel 36. After folding and forming the pair of seams 88 and 90, the disposable absorbent article 10 shown in FIG. 1 is obtained. The disposable absorbent article 10 has a waist opening 92 and a pair of leg openings 94 and 96. Since the front and back panels, 12 and 36 respectively, are formed from a stretchable elastic material, the waist opening 92 and the pair of leg openings 94 and 96 can expand or contract in size to accommodate the anatomy of the user.

Method

Referring now to FIG. 7, a flow diagram is depicted showing a method of manufacturing the disposable absorbent article 10. The method includes the steps of forming a front panel 12 having a first zone 14 and a second zone 16. The first zone 14 is extensible and retractable and the second zone 16 is non-extensible and non-retractable. The front panel 12 also has an inner surface 18, an outer surface 20, a first side edge 26 and a second side edge 28. Furthermore, the second zone 16 is spaced inward from the first and second side edges, 26 and 28 respectively. The method also includes forming a back panel 36 having a first zone 38 and a second zone 40. The first zone 38 is extensible and retractable and the second zone 40 is non-extensible and non-retractable. The back panel 36 also has an inner surface 42, an outer surface 44, a first side edge 50 and a second side edge 52. Furthermore, the second zone 40 of the back panel 36 is spaced inward from the first and second side edges, 50 and 52 respectively, of the back panel 36. The method further includes forming an absorbent assembly 60 having a liquid pervious bodyside liner 62, a liquid-impervious outer cover 64, and an absorbent 66 positioned therebetween. The absorbent assembly 60 has a first end 70 and a second end 72 and the absorbent assembly 60 is secured to the front and back panels, 12 and 36 respectively. The first end 70 of the absorbent assembly 60 is secured to the second zone 16 of the front panel 12 and the second end 72 of the absorbent assembly 60 is secured to the second zone 40 of the back panel 36. The absorbent assembly 60 can be secured to either the inner or outer surfaces 18 and 42 or 20 and 44 of the front and back panels, 12 and 36 respectively. The absorbent assembly 60 is capable of being folded to enable the first and second side edges, 26 and 28 respectively, of the front panel 12 to align with the first and second side edges 50 and 52 respectively, of the back panel 36. Lastly, the method includes joining the front and back panels, 12 and 36 respectively, together by a pair of seams 88 and 90 at the first and second side edges 74 and 76 to form a disposable absorbent article 10 having a waist opening 92 and a pair of leg openings 94 and 96.

While the invention has been described in conjunction with a specific embodiment, it is to be understood that many alternatives, modifications and variations will be apparent to those skilled in the art in light of the foregoing description.

12

Accordingly, this invention is intended to embrace all such alternatives, modifications and variations that fall within the spirit and scope of the appended claims.

We claim:

1. A disposable absorbent article comprising:

- a) a front panel having a first zone and a second zone, said first zone being extensible and retractable and said second zone being non-extensible and non-retractable, said front panel also having a first end, a second end, a first side edge and a second side edge, said first zone extending from said first side edge to said second side edge, and said second zone is spaced inward from said first and second side edges and inward from said first end and coterminous with said second end, such that said extensible and retractable first zone abuts said first and second side edges along their entire length and surrounds said second zone on three sides;
- b) a back panel having a first zone and a second zone, said first zone being extensible and retractable and said second zone being non-extensible and non-retractable, said back panel also having a first side edge and a second side edge, and said second zone of said back panel is spaced inward from said first and second side edges of said back panel;
- c) an absorbent assembly including a liquid pervious bodyside liner, a liquid-impervious outer cover, and an absorbent positioned therebetween, said absorbent assembly having a first end and a second end, said absorbent assembly being secured to said front and back panels, said first end of said absorbent assembly being secured to said second zone of said front panel and said second end of said absorbent assembly being secured to said second zone of said back panel, and said absorbent assembly capable of being folded to enable said first and second side edges of said front panel to align with said first and second side edges of said back panel; and
- d) a pair of seams joining said front and back panels together at said first and second side edges to form a disposable absorbent article having a waist opening and a pair of leg openings, said article is designed to be pulled up around a user's torso without having to first open said article.

2. The disposable absorbent article of claim 1 wherein each of said second zones is formed from the same material as said first zone but does not possess extensible and retractable properties.

3. The disposable absorbent article of claim 1 wherein said second zone of said front panel has a smaller surface area than said first zone of said front panel.

4. The disposable absorbent article of claim 3 wherein said second zone of said front panel has a surface area that is less than about 25% of the surface area of said first zone.

5. The disposable absorbent article of claim 4 wherein said second zone of said front panel has a surface area that is less than about 20% of the surface area of said first zone.

6. The disposable absorbent article of claim 1 wherein said front panel has an inner surface and said absorbent assembly is secured to said inner surface and said first end of said absorbent assembly is secured at a location that is closer to said second end of said front panel.

7. The disposable absorbent article of claim 1 wherein said back panel has an inner surface and said absorbent assembly is secured to said inner surface, and wherein said second zone of said back panel has a smaller surface area than said first zone of said back panel.

13

8. The disposable absorbent article of claim 7 wherein said first zone of said front panel has extensible and retractable properties in two or more directions.

9. The disposable absorbent article of claim 1 wherein said second zone of said back panel has a larger surface area than said second zone of said front panel.

10. A disposable absorbent article comprising:

- a) a front panel having a first zone and a second zone, said first zone being extensible and retractable and said second zone being non-extensible and non-retractable, said front panel also has a first end, a second end, a first side edge and a second side edge, said first zone extending from said first side edge to said second side edge, and said second zone is spaced inward from said first and second side edges and inward from said first end and coterminous with said second end, such that said extensible and retractable first zone abuts said first and second side edges along their entire length and surrounds said second zone on three sides;
- b) a back panel having a first zone and a second zone, said first zone being extensible and retractable and said second zone being non-extensible and non-retractable, said back panel also has a first end, a second end, a first side edge and a second side edge, said second zone of said back panel is spaced inward from said first and second side edges of said back panel and has an edge that is coterminous with the second end of the back panel and is surrounded on three sides by the first zone, and said second zone of said back panel has a larger surface area than said second zone of said front panel;
- c) an absorbent assembly including a liquid pervious bodyside liner, a liquid-impervious outer cover, and an absorbent positioned therebetween, said absorbent assembly having a first end, a second end, a first side edge and a second side edge, said absorbent assembly being secured to said front and back panels, said first end of said absorbent assembly being secured to said second zone of said front panel and said second end of said absorbent assembly being secured to said second zone of said back panel, and said absorbent assembly capable of being folded to enable said first and second side edges of said front panel to align with said first and second side edges of said back panel; and
- d) at least one elastic member positioned adjacent to each of said first and second side edges of said absorbent assembly and situated between said bodyside liner and said outer cover; and
- e) a pair of seams joining said first and second side edges of said front and back panels together to form a disposable absorbent article having a waist opening and a pair of leg openings, said article is designed to be pulled up around a user's torso without having to first open said article.

11. The disposable absorbent article of claim 10 wherein said back panel has an inner surface and said absorbent assembly is secured to said inner surface, and said second zone of said back panel has a larger surface area than said second zone of said front panel.

12. The disposable absorbent article of claim 10 wherein said front panel has an inner surface and said absorbent assembly is secured to said inner surface, and said front panel has a first end and a second end and said first end of said absorbent assembly is secured at a location that is closer to said second end of said front panel.

13. The disposable absorbent article of claim 10 wherein said first end of said absorbent assembly is secured to said front panel at a location that is closer to said second end of

14

said front panel than to said first end of said front panel and said second end of said absorbent assembly is secured to said back panel at a location that is closer to said second end of said back panel than said first end of said back panel.

14. The disposable absorbent article of claim 10 wherein said second zone of said front panel is rectangular in configuration.

15. The disposable absorbent article of claim 10 wherein said second zone of said back panel is rectangular in configuration.

16. A method of forming a disposable absorbent article comprising the steps of:

- a) forming a front panel having a first zone and a second zone, said first zone being extensible and retractable and said second zone being non-extensible and non-retractable, said front panel being formed from a single integral elastomeric material that exhibits both extensible and retractable characteristics and is treated, fused, deadened, chopped or conditioned to form said second zone, said front panel also having a first end, a second end, a first side edge and a second side edge, said first zone extending from said first side edge to said second side edge, and said second zone is spaced inward from said first and second side edges and inward from said first end, such that said extensible and retractable first zone abuts said first and second side edges along their entire length;
- b) forming a back panel having a first zone and a second zone, said first zone being extensible and retractable and said second zone being non-extensible and non-retractable, said back panel being formed from a single integral elastomeric material that exhibits both extensible and retractable characteristics that is treated, fused, deadened, chopped, or conditioned to form said second zone, said back panel also having a first side edge and a second side edge, and said second zone of said back panel is spaced inward from said first and second side edges of said back panel;
- c) forming an absorbent assembly having a liquid pervious bodyside liner, a liquid-impervious outer cover, and an absorbent positioned therebetween, said absorbent assembly having a first end and a second end;
- d) securing said absorbent assembly to said front and back panels, said first end of said absorbent assembly being secured to said second zone of said front panel and said second end of said absorbent assembly being secured to said second zone of said back panel;
- e) folding said absorbent assembly so that said first and second side edges of said front panel are aligned with said first and second side edges of said back panel; and
- f) joining said front and back panels together by a pair of seams formed at said first and second side edges to form a disposable absorbent article having a waist opening and a pair of leg openings, said article is designed to be pulled up around a user's torso without having to first open said article.

17. The method of claim 16 wherein each of said front and back panels has an inner surface and said absorbent assembly is secured to said inner surfaces of said front and back panels.

18. The method of claim 16 wherein each of said front and back panels has an outer surface and said absorbent assembly is secured to said outer surfaces of said front and back panels.

19. The method of claim 16 wherein said first zone of said front and back panels encloses three sides of said second zone.

15

20. The method of claim **16** wherein said second zone of said front and back panels is not extended before said absorbent assembly is secured thereto.
